

IN THE SPECIFICATION

Please amend the paragraph within the specification beginning page 18, line 1 with the following:

ABSTRACT

A method and apparatus for reading out information from an information carrier, the information including at least a first signal of at least partly encrypted content, to an apparatus for storing such information as well as to corresponding methods.

~~Embodiment~~ Embodiments propose a realization of the Content Scrambling System (CSS) rule: CSS encrypted content on a recordable disc should ~~be~~ be refused. In order to be able to use a wobbled disc for distinguishing ROM-discs from recordable discs, it is required that in the content on "new" discs there will be a "wobble-trigger". This trigger should be easily detectable from looking just at the content, it should not be easily removable by a hacker and it should not affect content preparation. It is thus proposed for reading out information, detecting a second signal logically embedded in the first signal, detecting a physical mark used for storing at least part of the information on the information carrier, and refusing play back of the information read from the information carrier if a second signal but no physical mark has been detected.
